The document provides a list of vaccine and medicine names from adverse event reports for COVID-19 vaccines where 'adverse event following immunisation' was coded as an adverse event. The list includes reports received between 1 December 2020 and 11 April 2024. To protect patient privacy, non-COVID-19 vaccine medicines and/or concomitant medicines may have been redacted if there was a unique combination of medicines which could be used to link the information to an individual report. If the report remained identifiable based on COVID-19 vaccine alone, then the onset time data were redacted.

Onset time is calculated using vaccination date(s) and reaction onset date where these data are available. In reports with more than one onset date, for example where different reactions were reported to start on different dates, the earliest onset date is used in the automated calculation.

In reports with multiple vaccination dates, the onset time may be calculated as a negative number, for example if a reaction occurred between two doses being administered.

As the onset time in this data set is an automated calculation using the earliest onset date for an individual reaction, it may not reflect the time to onset reported for 'adverse event following immunisation'.

This is a point in time data extract and the onset time data may change if new information is received by the TGA.

## Medicine (Onset Time)

The document provides a list of vaccine and medicine names from adverse event reports for COVID-19 vaccines where cardiac arrest was reported as an adverse event. The list includes reports received between 1 December 2020 and 11 April 2024. To protect patient privacy, non-COVID-19 vaccine medicines and/or concomitant medicines may have been redacted if there was a unique combination of medicines which could be used to link the information to an individual report. If the report remained identifiable based on COVID-19 vaccine alone, then the onset time data were redacted.

Onset time is calculated using vaccination date(s) and reaction onset date where these data are available. In reports with more than one onset date, for example where different reactions were reported to start on different dates, the earliest onset date is used in the automated calculation.

In reports with multiple vaccination dates, the onset time may be calculated as a negative number, for example if a reaction occurred between two doses being administered.

As the onset time in this data set is an automated calculation using the earliest onset date for an individual reaction, it may not reflect the time to onset reported for cardiac arrest.

## **Medicine (Onset Time)**

APO-Macrogol Plus Electrolytes (macrogol 3350; potassium chloride; sodium bicarbonate; sodium chloride) - Concomitant (-); Atozet (atorvastatin calcium trihydrate; ezetimibe) - Concomitant (-); COMIRNATY COVID-19 vaccine (tozinameran) - Suspect (-); COVID-19 Vaccine AstraZeneca (ChAdOx1-S (Viral vector)) - Suspect (-) ); DOUBLUTS (dutasteride; tamsulosin hydrochloride) - Concomitant (-); Eliquis (apixaban) - Concomitant (-); Minax (metoprolol tartrate) - Concomitant (-); Trade Name Not Specified (Senna) - Concomitant (-); Trade Name Not Specified (escitalopram oxalate) - Concomitant (-); Trade Name Not Specified (esomeprazole) -Concomitant (-); Trade Name Not Specified (ramipril) - Concomitant (-) COVID-19 Vaccine AstraZeneca (ChAdOx1-S (Viral vector)) - Suspect (0 days); Panafcort (prednisone) -Concomitant (-); Trade Name Not Specified (amitriptyline) - Concomitant (-); Trade Name Not Specified (esomeprazole) - Concomitant (-) COMIRNATY COVID-19 vaccine (tozinameran) - Concomitant (# days); COMIRNATY COVID-19 vaccine (tozinameran) - Concomitant (# days); NUVAXOVID COVID-19 Vaccine (SARS-CoV-2 rS (NVX-CoV2373)) -COMIRNATY COVID-19 vaccine (tozinameran) - Suspect (-) COMIRNATY COVID-19 vaccine (tozinameran) - Suspect (0 days) COMIRNATY COVID-19 vaccine (tozinameran) - Suspect (0 days)

```

The document provides a list of vaccine and medicine names from adverse event reports for COVID-19 vaccines where pulmonary embolism was reported as an adverse event. The list includes reports received between 1 December 2020 and 11 April 2024. To protect patient privacy, non-COVID-19 vaccine medicines and/or concomitant medicines may have been redacted if there was a unique combination of medicines which could be used to link the information to an individual report. If the report remained identifiable based on COVID-19 vaccine alone, then the onset time data were redacted.

Onset time is calculated using vaccination date(s) and reaction onset date where these data are available. In reports with more than one onset date, for example where different reactions were reported to start on different dates, the earliest onset date is used in the automated calculation.

In reports with multiple vaccination dates, the onset time may be calculated as a negative number, for example if a reaction occurred between two doses being administered.

As the onset time in this data set is an automated calculation using the earliest onset date for an individual reaction, it may not reflect the time to onset reported for pulmonary embolism.

## Medicine (Onset Time)

```
APOHEALTH Chloramphenicol (chloramphenicol) - Concomitant (-); COVID-19 Vaccine AstraZeneca (ChAdOx1-
S (Viral vector)) - Suspect (-); DBL Doxycycline (doxycycline hyclate) - Concomitant (-); FluQuadri Vaccine
(Influenza virus haemagglutinin) - Concomitant (-); Lipitor (atorvastatin calcium) - Concomitant (-); Trade

vaccines where cerebrovascular accident was reported as an adverse event. The list includes reports received between 1 December 2020 and 11 April 2024. To protect patient privacy, non-COVID-19 vaccine medicines and/or concomitant medicines may have been redacted if there was a unique combination of medicines which could be used to link the information to an individual report. If the report remained identifiable based on COVID-19 vaccine alone, then the onset time data were redacted.

Onset time is calculated using vaccination date(s) and reaction onset date where these data are available. In reports with more than one onset date, for example where different reactions were reported to start on different dates, the earliest onset date is used in the automated calculation.

In reports with multiple vaccination dates, the onset time may be calculated as a negative number, for example if a reaction occurred between two doses being administered.

As the onset time in this data set is an automated calculation using the earliest onset date for an individual reaction, it may not reflect the time to onset reported for cerebrovascular accident.

This is a point in time data extract and the onset time data may change if new information is received by the TGA.

## Medicine (Onset Time)

Acimax (omeprazole; omeprazole magnesium) - Concomitant (-); Avsartan (irbesartan) - Concomitant (-); COMIRNATY COVID-19 vaccine (tozinameran) - Suspect (40 days); Minax (metoprolol tartrate) - Concomitant (-); Trade Name Not Specified (Product not Coded) - Concomitant (-); Trade Name Not Specified (allopurinol) - Concomitant (-); Vimpat (lacosamide) - Concomitant (-)

```

The document provides a list of vaccine and medicine names from adverse event reports for COVID-19 vaccines where myocardial infarction was reported as an adverse event. The list includes reports received between 1 December 2020 and 11 April 2024. To protect patient privacy, non-COVID-19 vaccine medicines and/or concomitant medicines may have been redacted if there was a unique combination of medicines which could be used to link the information to an individual report. If the report remained identifiable based on COVID-19 vaccine alone, then the onset time data were redacted.

Onset time is calculated using vaccination date(s) and reaction onset date where these data are available. In reports with more than one onset date, for example where different reactions were reported to start on different dates, the earliest onset date is used in the automated calculation.

In reports with multiple vaccination dates, the onset time may be calculated as a negative number, for example if a reaction occurred between two doses being administered.

As the onset time in this data set is an automated calculation using the earliest onset date for an individual reaction, it may not reflect the time to onset reported for myocardial infarction.

This is a point in time data extract and the onset time data may change if new information is received by the TGA.

## Medicine (Onset Time)

vaccines where acute myocardial infarction was reported as an adverse event. The list includes reports received between 1 December 2020 and 11 April 2024. To protect patient privacy, non-COVID-19 vaccine medicines and/or concomitant medicines may have been redacted if there was a unique combination of medicines which could be used to link the information to an individual report. If the report remained identifiable based on COVID-19 vaccine alone, then the onset time data were redacted.

Onset time is calculated using vaccination date(s) and reaction onset date where these data are available. In reports with more than one onset date, for example where different reactions were reported to start on different dates, the earliest onset date is used in the automated calculation.

In reports with multiple vaccination dates, the onset time may be calculated as a negative number, for example if a reaction occurred between two doses being administered.

As the onset time in this data set is an automated calculation using the earliest onset date for an individual reaction, it may not reflect the time to onset reported for acute myocardial infarction.

This is a point in time data extract and the onset time data may change if new information is received by the

## Medicine (Onset Time)
